

Put your eyes on it

fiveEyes

professional surveillance system

FiveEyes is an intelligent surveillance system, which turns a computer camera into a powerful invisible surveillance tool, without the use of VCR or other devices.

Its intuitive design, along with a quick installation process, allows the user to take full advantage of the efficient video based activity and intrusion control provided by FiveEyes.

Surveillance at:

- Personal desk
- Office room
- Buildings
- Offices and stores entrances
- Home door
- Kid's room
- Home office

Invisible surveillance mode

Use your computer camera to take snapshots in automatic, timed or combined mode. The automatic mode will take a snapshot every time FiveEyes detects activity on the area under surveillance; Timed mode will constantly capture snapshots within a scheduled period of time.

Activate or deactivate the surveillance system using a configurable schedule for different periods in different days.

Intelligent management of space disk

Define the disk limit usage according to the volume of disk space you want to use for the snapshots, from 0 to No Limit.

Implement a cycle method that will replace older snapshots by the new ones when there is no disk available.

Useful settings tune

Adjust the surveillance mode and detection settings so that it fits your combination of working environment, camera and capture device. Tune sensitivity, light, resolution, noise reduction, exclusion areas or play a sound/ message each time a new snapshot is taken. Use the Live Analysis simulation to test defined detection settings, and confirm if the system is detecting enough motion to save a snapshot.

Easy image view and timeline navigation

Use the snapshot Viewer Window to easily navigate between the snapshots taken when surveillance is ON. The saved activity can be viewed and played in a timeline displayed on a daily, weekly or monthly base.

Web Monitoring

Monitor your surveillance online by publishing the images on a webpage. FiveEyes settings allow user to define the server path, the number of snapshots to display (max 50), and the period of time between each image refreshment.

Invisible surveillance mode

Automatically takes snapshots every time detects activity

Easy image navigation

View and search saved activity played in timeline

Exclusion areas

Define exclusion areas and other useful settings to adapt working environment

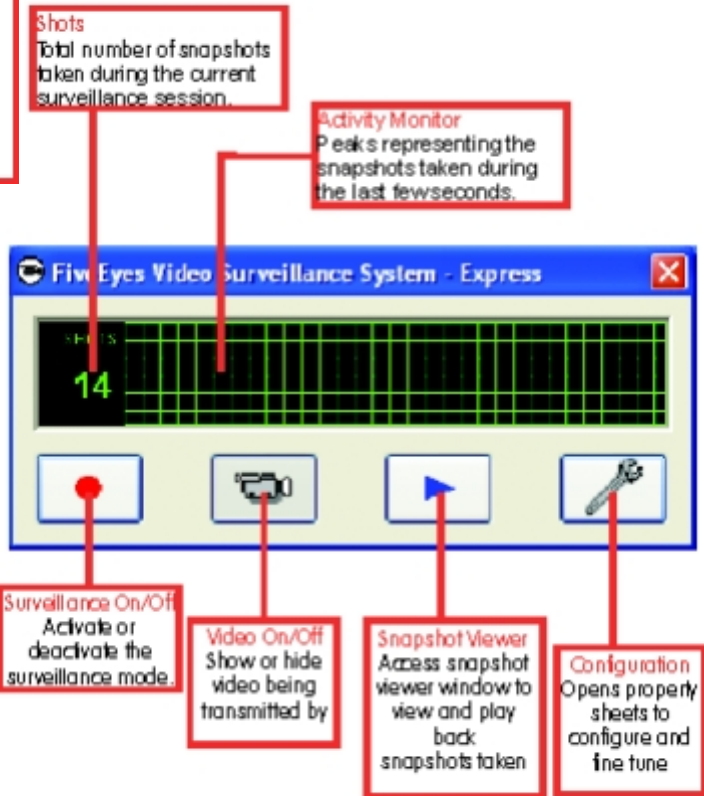

Scheduler system

Activate or deactivate the surveillance system using a configurable schedule system

Ideal for home and business applications, FiveEyes permanently "watches" and records snapshots with significant activity, offering the user intuitive graphs and navigation control in order to locate and analyse every frame of the resulting snapshot images database.

FiveEyes Features

Package & Installation

Setup programs on CD
Microsoft Windows Compatible
Key Five Protection (SmartCard) - with serial or USB interface
Manual Printed & On-Line

Tools

Invisible Surveillance mode
Automatic record on motion detection
Intelligent management of space on disk
Easy image store and backup
View and navigation features for snapshots
Live monitoring
Sensitivity & Light fine tuning settings
Exclusion areas definition
Automatic or timed surveillance mode with cycle method settings
Limit disk usage configuration with cycle method settings
Webserver storing with refresh delay

Miscellaneous

Free updates from our website
Camera driver tester tool available free of charge
